

KDM

LAB – III

Submitted by
Mahesh Vemula
16158759

1. Make a **Mashup application** including various services (e.g., Google Map, Google Chart, Google Search, Yahoo, Amazon, Twitter, Facebook) Web Services (e.g., Google Map Services, Weather Services) Android App Technology

Step 1: Create new android application using ECLIPSE

The screenshot shows the 'New Android Application' dialog box in the Eclipse IDE. The dialog has a title bar with the text 'New Android Application' and standard window controls. Inside, there's a section titled 'New Android Application' with a warning icon and a note: 'The application name for most apps begins with an uppercase letter'. Below this, there are four text input fields: 'Application Name' (containing 'androidap'), 'Project Name' (containing 'androidap'), 'Package Name' (containing 'com.androidap' followed by a cursor and 'alkdjfl'), and 'Minimum Required SDK' (a dropdown menu showing 'API 8: Android 2.2 (Froyo)'). Below these are three more dropdown menus: 'Target SDK' (showing 'API 18'), 'Compile With' (showing 'API 19: Android 4.4.2'), and 'Theme' (showing 'Holo Light with Dark Action Bar'). At the bottom, there's a lightbulb icon and a note: 'The package name must be a unique identifier for your application. It is typically not shown to users, but it *must* stay the same for the lifetime of your application; it is how multiple versions of the same application are considered the "same app". This is typically the reverse domain name of your organization plus one or more application identifiers, and it'. At the very bottom, there are four buttons: '< Back', 'Next >', 'Finish', and 'Cancel'.

New Android Application

New Android Application

⚠ The application name for most apps begins with an uppercase letter

Application Name: androidap

Project Name: androidap

Package Name: com.androidapalkdjfl

Minimum Required SDK: API 8: Android 2.2 (Froyo)

Target SDK: API 18

Compile With: API 19: Android 4.4.2

Theme: Holo Light with Dark Action Bar

💡 The package name must be a unique identifier for your application. It is typically not shown to users, but it *must* stay the same for the lifetime of your application; it is how multiple versions of the same application are considered the "same app". This is typically the reverse domain name of your organization plus one or more application identifiers, and it

? < Back Next > Finish Cancel

Step 2: Now create and modify the activities and layout in java and XML.

For creating this application files created : MainActivity.java

Secondpage.java

Weatherpage.java

Countrypage.java

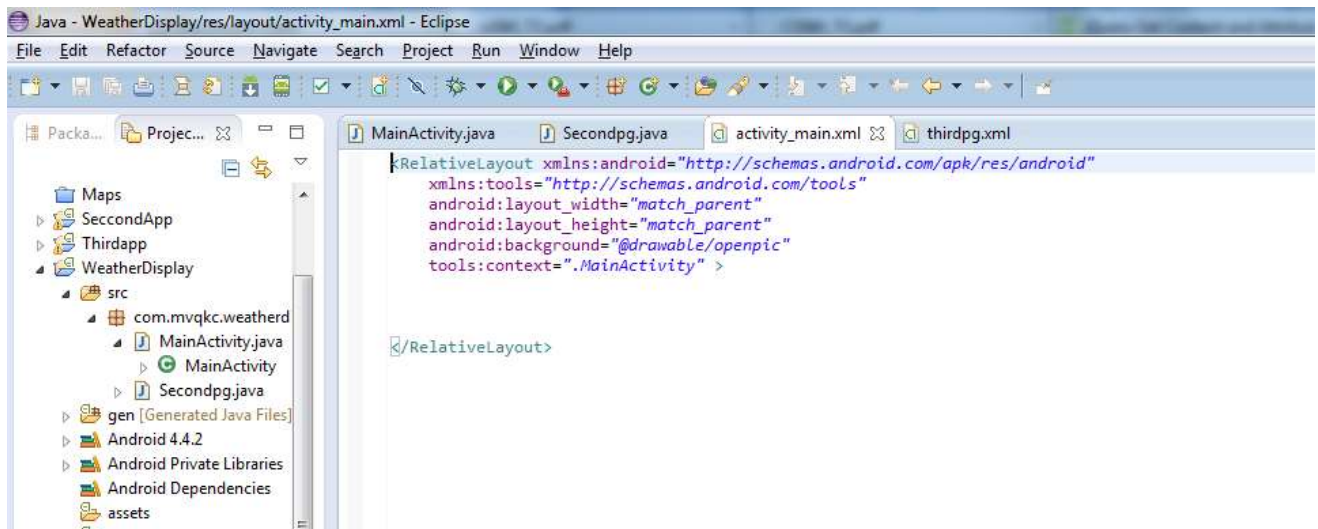

Activity_main.xml

Secondpage.xml

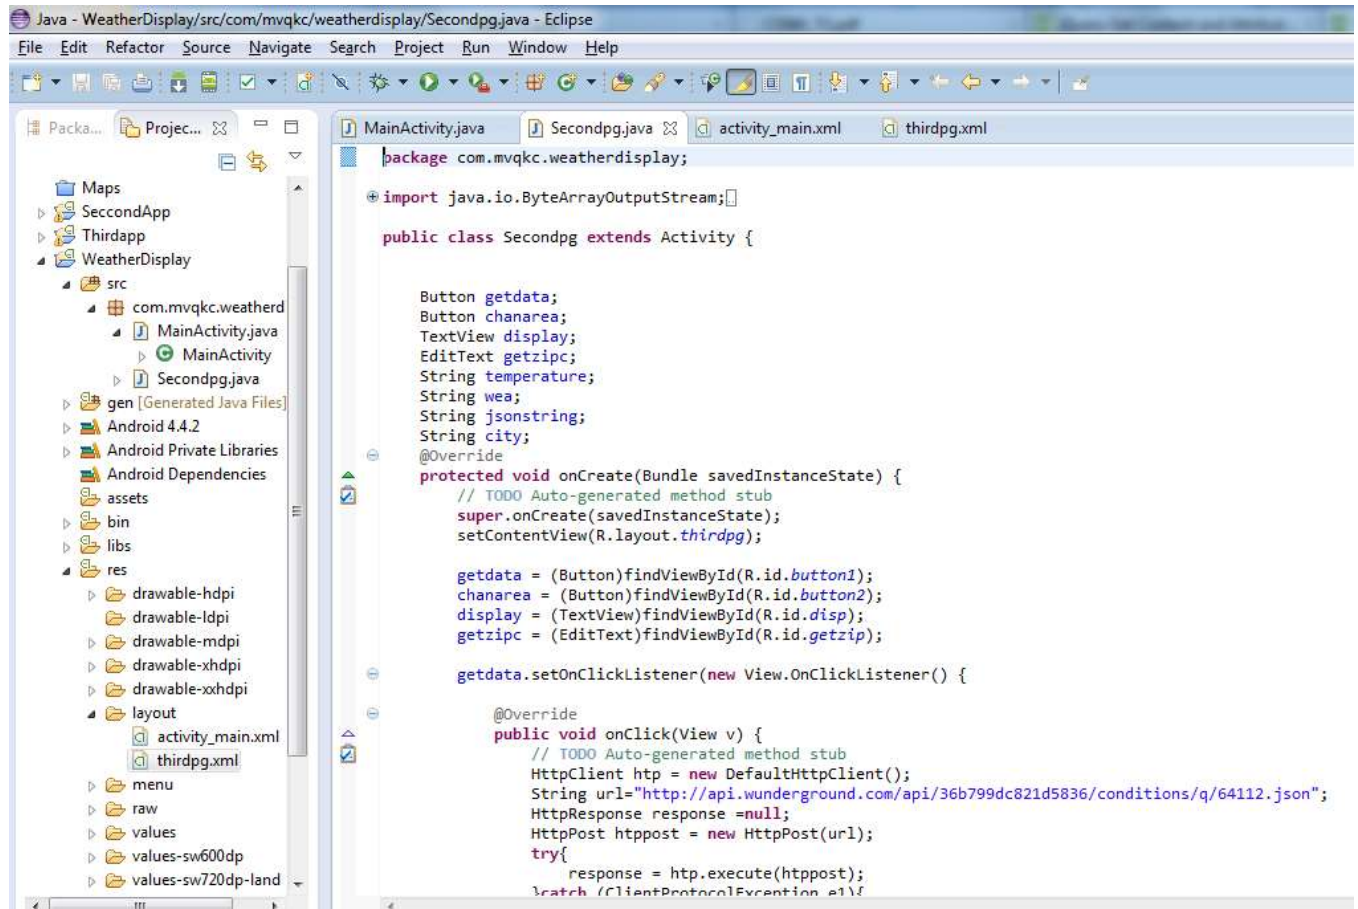

Weatherpage.xml

Countrypage.xml

AppManifest.xml

Main Activity XML File

Main Activity Java File

Window of app XML

Second window editing in Graphical View

STEP 3: Now after editing the required file we test application on created Virtual AVD

Select the required Virtual AVD to test app

The first screen of virtual AVD

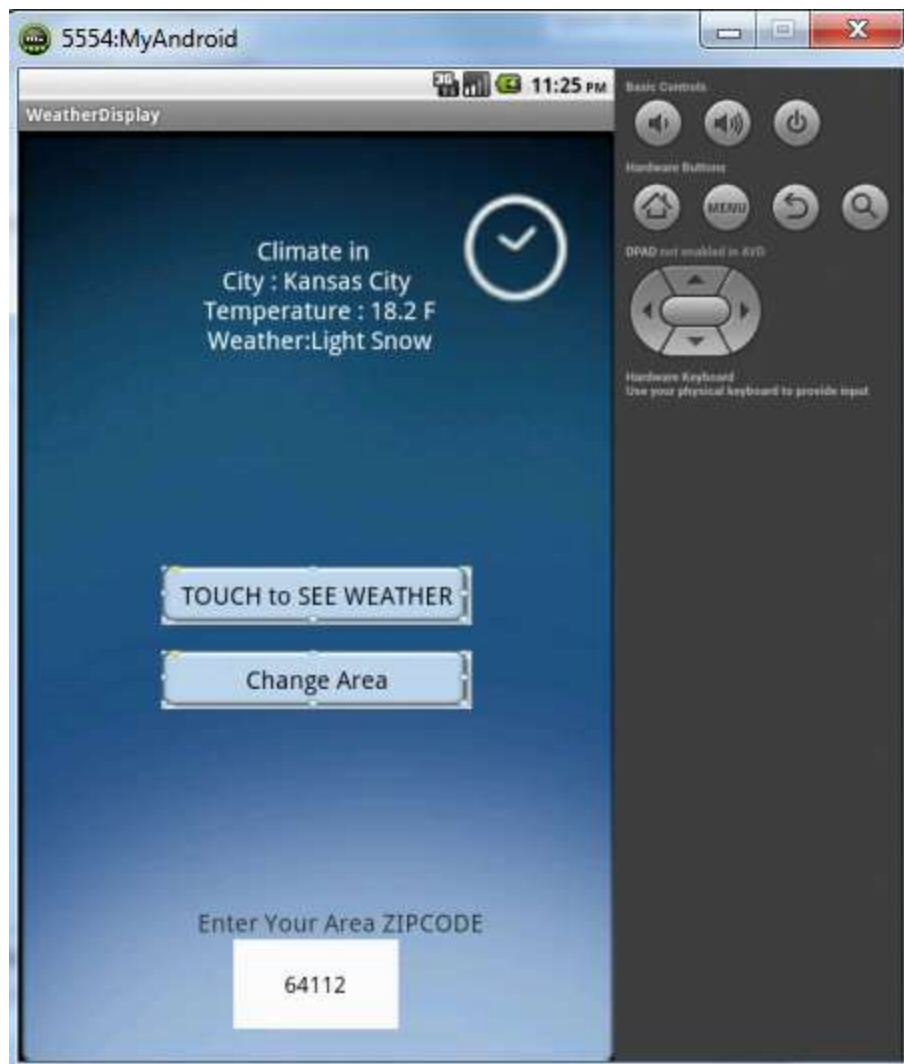

Application First Screen

Application second page view

The application weather page view

View of application after clicking on Touch to SEE WEATHER

View of application after entering zipcode and clicking on change area

Application Country page view

After entering country the application returning the number of states and territories

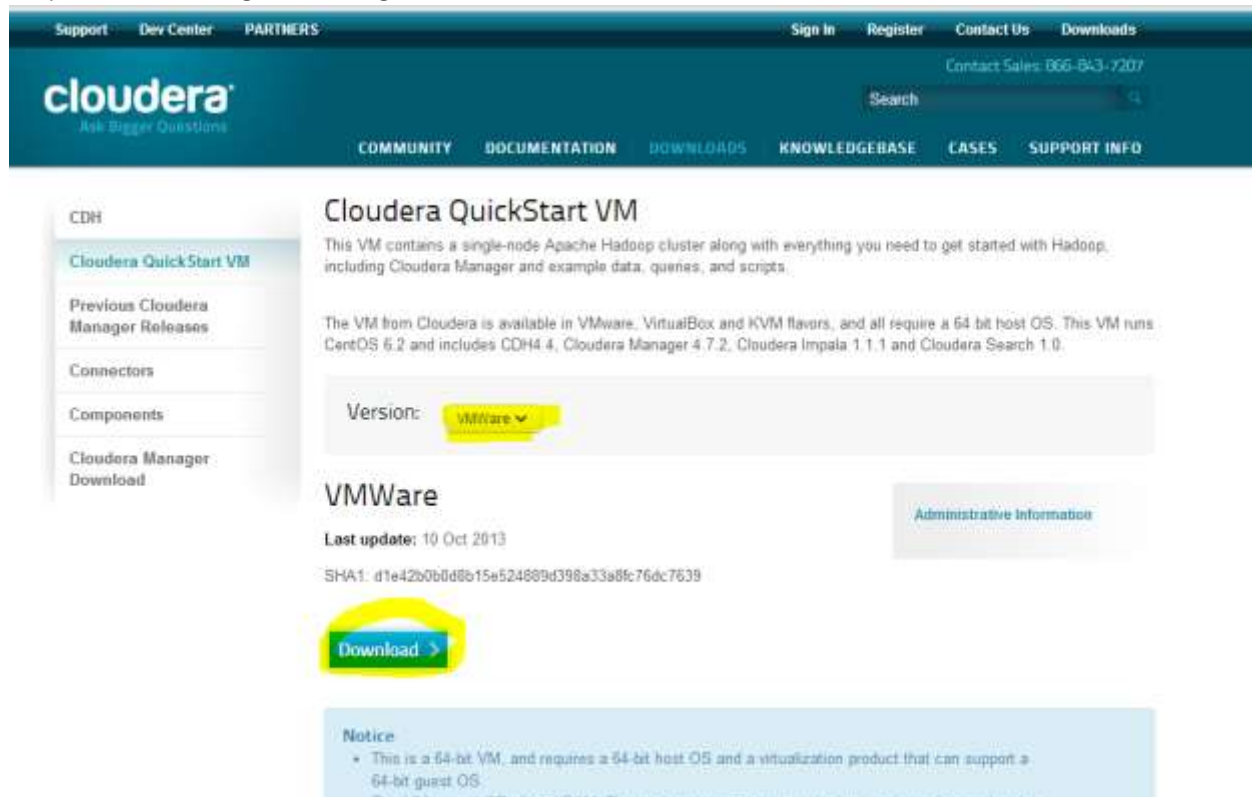

Finally an android application is successful designed to show weather by zipcode input and Country details with country name as input.

The additional files are uploaded in Github lab3 Folder

Link : <https://github.com/Maresh-Vemula/KDM>

2. **Cloudera/MapReduce**: Download the Cloudera Image, implement the WordCount MapReduce and run it.

Step 1: Downloading cloud image

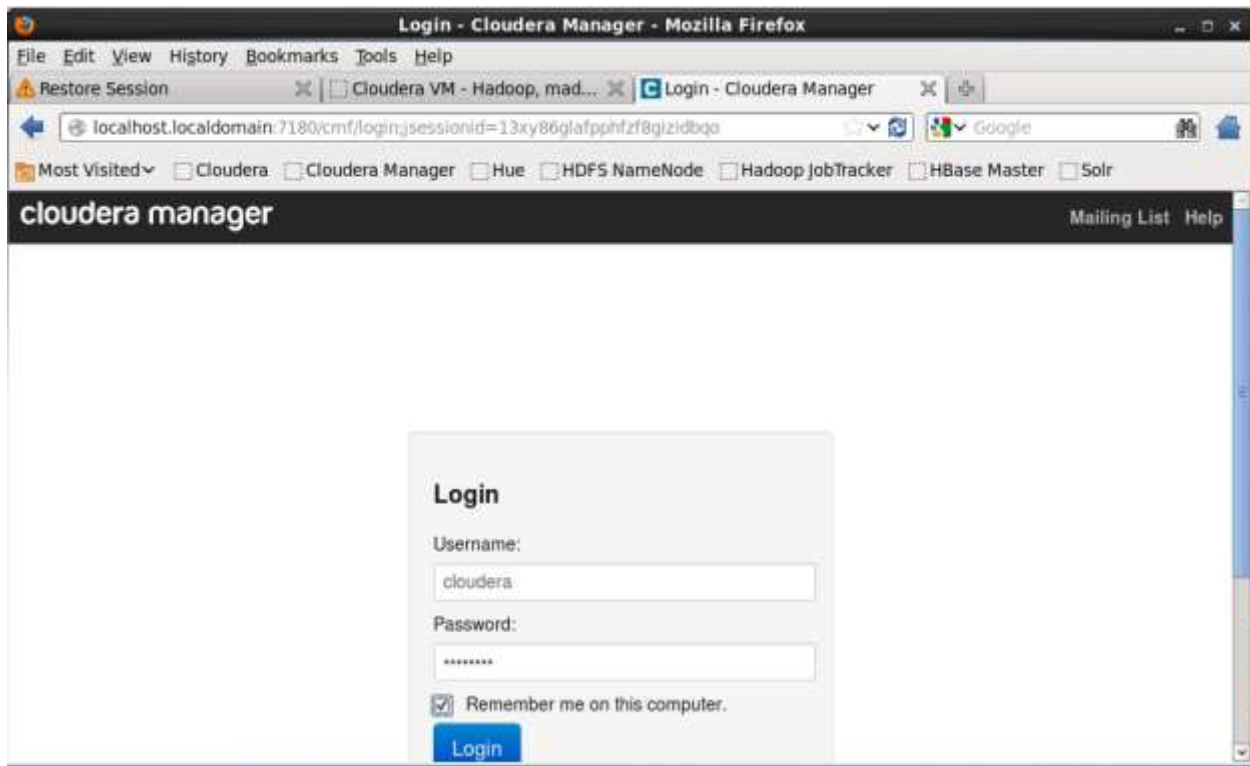

The screenshot shows the Cloudera website's 'Downloads' section for the 'Cloudera QuickStart VM'. The page has a dark teal header with navigation links: Support, Dev Center, PARTNERS, Sign In, Register, Contact Us, and Downloads. A search bar is also present. Below the header, a sidebar on the left lists categories: CDH, Cloudera QuickStart VM (selected), Previous Cloudera Manager Releases, Connectors, Components, and Cloudera Manager Download. The main content area is titled 'Cloudera QuickStart VM' and describes it as a single-node Apache Hadoop cluster. It specifies that the VM is available in VMware, VirtualBox, and KVM flavors, all requiring a 64-bit host OS. A 'Version:' dropdown menu is set to 'VMWare'. Below this, the 'VMWare' section shows the 'Last update' as '10 Oct 2013' and a SHA1 hash. A prominent yellow 'Download' button is visible. A 'Notice' box at the bottom states: 'This is a 64-bit VM, and requires a 64-bit host OS and a virtualization product that can support a 64-bit guest OS.'

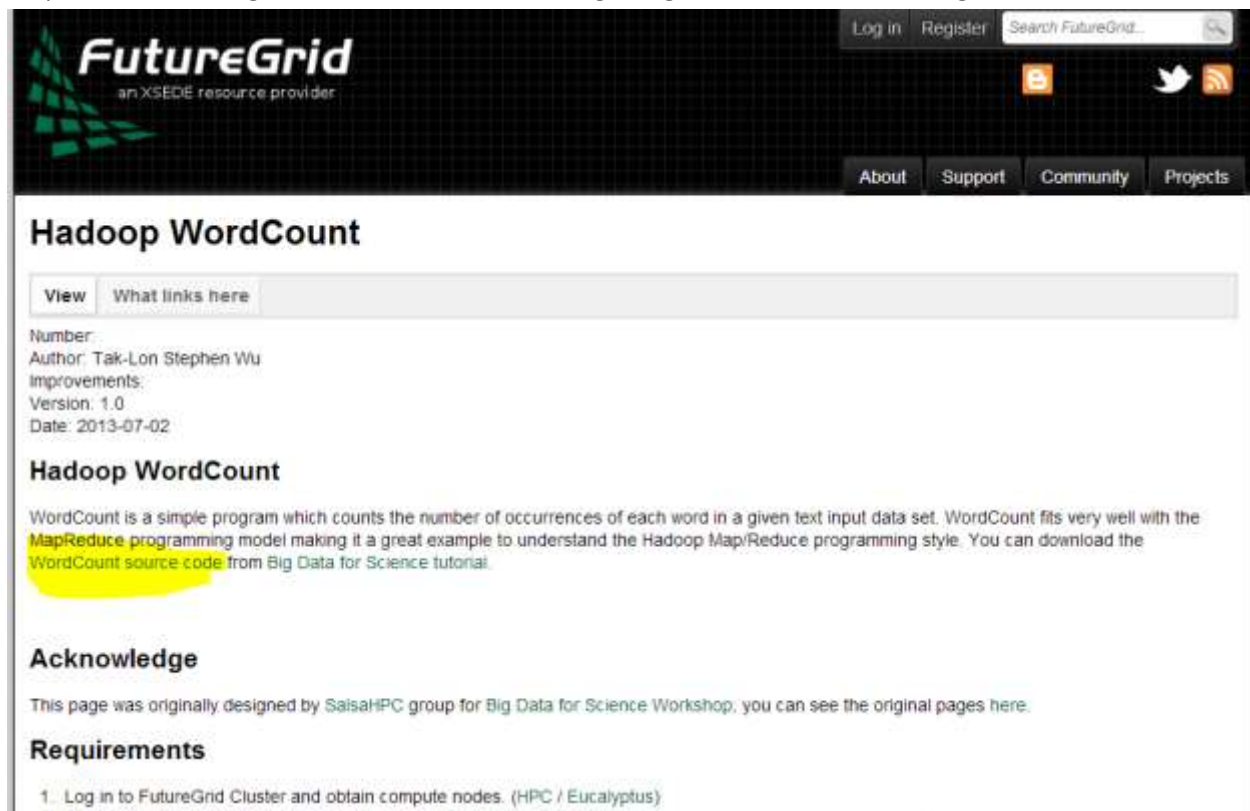

Step 2: open image using VM player

Step 3: open cloudera manager entering the credentials.

Step 4 : Downloading Word Count file and running using terminal. Download Page:

Step 5: Extracting the files

```
cloudera@localhost:~/Downloads/Hadoop
File Edit View Search Terminal Help
[cloudera@localhost ~]$ dir
datasets Documents eclipse Music Public Videos
Desktop Downloads lib Pictures Templates workspace
[cloudera@localhost ~]$ cd Downloads
[cloudera@localhost Downloads]$ dir
hadoop-0.20.203.0-customized.tar.gz Hadoop-WordCount Hadoop-WordCount.zip
[cloudera@localhost Downloads]$ cd Hadoop-WordCount
```

Step 5: Input text folder to processing folder

```
cloudera@localhost:~/Downloads/Hadoop-WordCount
File Edit View Search Terminal Help
[cloudera@localhost ~]$ cd Downloads/
[cloudera@localhost Downloads]$ cd Hadoop-WordCount
[cloudera@localhost Hadoop-WordCount]$ ls
build.sh classes clean.sh input wordcount.jar WordCount.java
[cloudera@localhost Hadoop-WordCount]$ hadoop fs -put input/Word_Count_input.txt
input2
put: `input2': File exists
[cloudera@localhost Hadoop-WordCount]$ hadoop fs -put input/Word_Count_input.txt
input5
[cloudera@localhost Hadoop-WordCount]$ hadoop jar wordcount.jar WordCount input5
output5
14/02/13 10:10:33 WARN mapred.JobClient: Use GenericOptionsParser for parsing th
e arguments. Applications should implement Tool for the same.
14/02/13 10:10:35 INFO input.FileInputFormat: Total input paths to process : 1

[cloudera@localhost Hadoop-WordCount]$
```

Step 7: output file

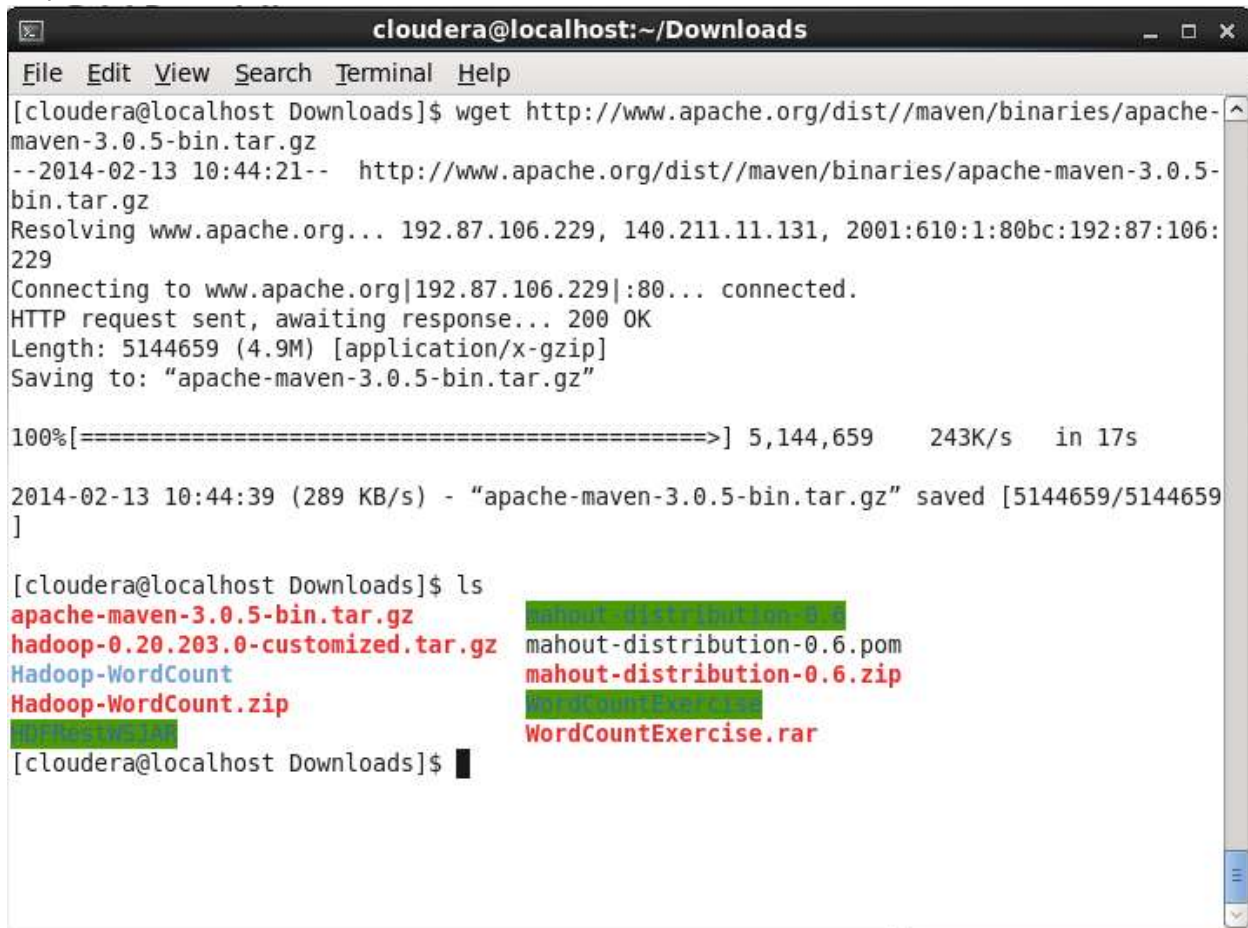

A terminal window titled "cloudera@localhost:~" with a menu bar (File, Edit, View, Search, Terminal, Help). The terminal displays the output of a word frequency analysis. The output consists of words followed by their frequency counts, with some words having counts in parentheses. The words are listed in descending order of frequency. The terminal ends with a prompt "[cloudera@localhost ~]\$".

```
you. 14
you." 15
you; 1
you? 2
you?" 23
young 42
young, 7
young. 2
young." 1
younger 1
youngest 3
your 74
yours," 1
yours?" 1
yourself 5
yourself, 1
yourself. 1
yourself." 1
yourself; 1
youth 7
youth, 1
youth. 1
youthful 1
[cloudera@localhost ~]$
```

3. **Cloudera/Mahout:** Configure your Cloudera with Mahout. Run Naive Bayes classifier with the input data

Step 1: Download maven

```
cloudera@localhost:~/Downloads
File Edit View Search Terminal Help
[cloudera@localhost Downloads]$ wget http://www.apache.org/dist/maven/binaries/apache-maven-3.0.5-bin.tar.gz
